

1. PROJECT & TEAM INFORMATION

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models
- **Team ID:** SWTID-2026-7486
- **Team Leader:** Diwan Oli M

2. BRAINSTORMING OVERVIEW The core objective of the brainstorming session was to devise a technological solution that democratizes comic creation. The team evaluated multiple software approaches to determine the most viable, scalable, and user-friendly product architecture.

3. EVALUATION OF APPROACHES

- **Approach 1: Template-Based Comic Builder.** A drag-and-drop web tool where users select pre-drawn clip-art and type their own text. (Discarded: This still requires significant manual effort from the user and offers very limited creative freedom).
- **Approach 2: Text-to-Text Script Generator.** An AI tool that formats a user's idea into a professional comic script for artists to draw. (Discarded: This does not solve the core problem of lacking visual illustrations).
- **Approach 3: Fully Automated GenAI Pipeline.** A system that uses an LLM to generate the script and a Diffusion model to generate the images simultaneously, outputting a finished PDF. (Selected: This completely automates the workflow and provides maximum value to the user).

4. FEATURE PRIORITIZATION (CRITICALITY MATRIX) To ensure the successful development of Approach 3, the project features were prioritized as follows:

- **Crucial Features (Must be in the MVP):**
 - A web interface to accept user prompts, character names, and artistic styles.
 - Integration with Google Gemini for automated story outlining and dialogue generation.

- Integration with Hugging Face Stable Diffusion for dynamic image rendering.
- An automated backend logic to compile the text and images into a downloadable PDF format.
- **Important Features (Should be included for better UX):**
 - An interactive HTML preview page to read the comic before downloading.
 - Dropdown options for different story tones (e.g., Humorous, Dark) and art styles (e.g., Manga, Realistic).
- **Optional Features (Future Scope):**
 - User authentication and cloud storage to save generated comics.
 - Multi-chapter graphic novel generation (10+ pages).
- **Excluded Features (Out of Scope):**
 - Manual image editing tools (like crop, brush, or eraser) built into the web app.
