

1. PROJECT & TEAM INFORMATION

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models
- **Team ID:** SWTID-2026-7486
- **Team Leader:** Diwan Oli M
- **Team Members:** Siva, Akashdeepan, Abdul Bazith K, Mohamed Ibrahim
- **Domain:** Artificial Intelligence & Generative Models

2. INTRODUCTION TO VISUAL NARRATIVES :

Visual storytelling through comic books is a highly engaging medium that bridges the gap between traditional literature and visual art. It provides readers with an immersive experience by combining dialogue, narration, and illustrations. However, producing a graphic novel or comic strip is an incredibly specialized field. It demands a combination of creative writing, character design, and digital illustration skills—a combination that very few people naturally possess.

3. THE CREATIVE BOTTLENECK:

In today's creator economy, while writing has become highly accessible through various digital platforms, visual illustration remains a significant hurdle. For an individual with a compelling story idea, the traditional process of creating a comic is painstakingly slow and financially draining. It involves writing a script, drafting a storyboard, sketching, coloring, and final formatting. Hiring freelance graphic artists is often too expensive for hobbyists, students, and independent authors.

4. THE PROBLEM STATEMENT :

The fundamental issue this project tackles is the "Graphic Execution Gap." Specifically: "Storytellers, educators, and creative hobbyists lack an accessible, automated, and cost-free tool to instantly translate their written narrative concepts into a visually structured, multi-panel comic book."

5. GAPS IN CURRENT TECHNOLOGIES:

While standalone Generative AI image tools (like Midjourney or basic Stable Diffusion) are available, they do not solve this specific problem. They generate isolated, disconnected images and lack the contextual understanding required to build a sequential storyline. Furthermore, they do not offer automatic formatting to compile the generated art and text into a readable document.

6. THE COMICCRAFT SOLUTION"

To bridge this gap, our team proposes ComicCraft. This web application functions as an automated digital comic studio. By orchestrating Large Language Models (Google Gemini) for structured storytelling and Diffusion models (Hugging Face) for panel illustration, ComicCraft allows anyone to generate a fully formatted, downloadable comic PDF from a single text prompt.
