

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. DEMONSTRATION STRATEGY To effectively present the ComicCraft application to evaluators, a structured demonstration plan has been devised. This plan ensures that the complex backend AI orchestration is clearly visible and understandable during a short presentation timeframe.

3. STEP-BY-STEP DEMO EXECUTION PLAN

- **Phase 1: Environment Initialization (Local Setup):** The demo will begin by showing the activation of the Python virtual environment and the launch of the Uvicorn local server (<http://127.0.0.1:8000>). This proves the codebase is functional on a host machine.
- **Phase 2: User Input Simulation:** The presenter will navigate the web interface, explicitly selecting a specific genre and character (e.g., Sci-Fi, Cyber-Ninja) to demonstrate the application's versatility.
- **Phase 3: Execution and Backend Monitoring:** Upon form submission, the presenter will briefly showcase the terminal logs to highlight the asynchronous API calls being made to Google Gemini and Hugging Face.
- **Phase 4: Output Review:** The fully rendered web preview page will be presented, evaluating the logical consistency of the story panels and the quality of the downloaded images.
- **Phase 5: Document Retrieval:** The demonstration concludes by initiating the PDF download function, opening the local .pdf file to confirm that the programmatic layout logic (FPDF) operated without visual distortions.
